BASIC-ABSTRACT:

0.2-0.5°C  
4°C

Conservation of animal sperm involves diluting it with a protective medium which does not contain glycerine, then cooling it down, diluting the sperm for a second time, this time with a protective medium which does contain glycerine, and freezing. Cooling of the sperm is performed from +30 to +15 deg. C at a rate of 0.4-0.5 deg. C per minute, from +15 to +10 deg. C at a rate of 0.3-0.4 deg. C per minute and from +10 to +4 deg. C at a rate of 0.2-0.3 deg. C per minute. Equilibration with glycerine is performed at +4 to +5 deg. C for a period of 25-30 mins., and the sperm is frozen in vapours of liquid nitrogen at minus 120 to minus 140 deg. C for (8-8.5) mins.
